

Demonstration of Cloud Front

Step-1: Login to your AWS IAM user account

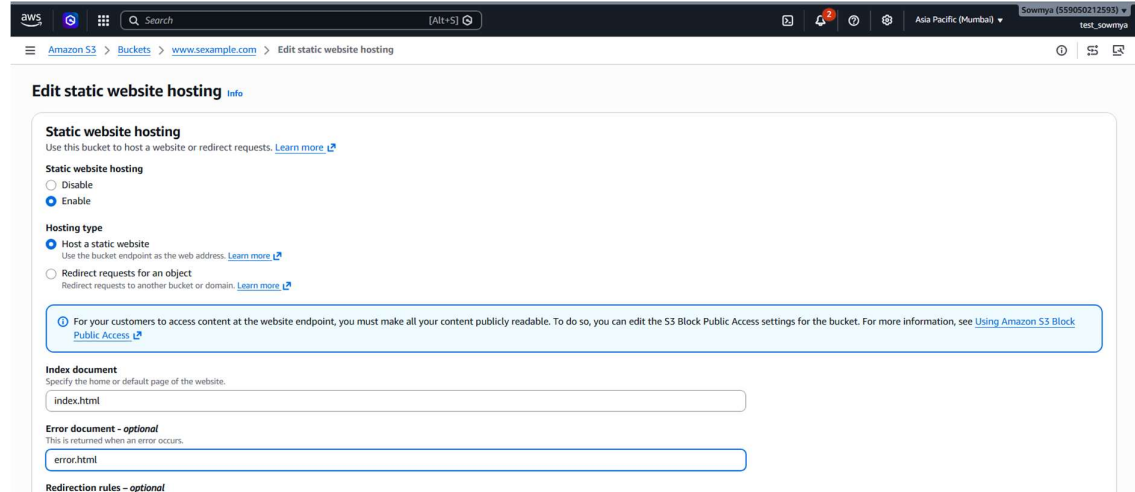

Here we host a website through s3 and we add cloud front distribution to it.

Step-2: Go to s3 and create an S3 bucket and optionally enable bucket versioning.

The screenshot shows the 'Create bucket' page in the AWS S3 console. The AWS Region is set to 'Asia Pacific (Mumbai) ap-south-1'. Under 'Bucket type', 'General purpose' is selected. The 'Bucket namespace' is set to 'Global namespace'. The 'Bucket name' is 'www.sexample.com'. The 'Copy settings from existing bucket - optional' section is visible. The 'Object Ownership' section shows 'ACLs are disabled (recommended)' selected.

Step-3: After creating select the bucket->go to properties->select static website hosting and enable it. Later, upload index.html to the bucket

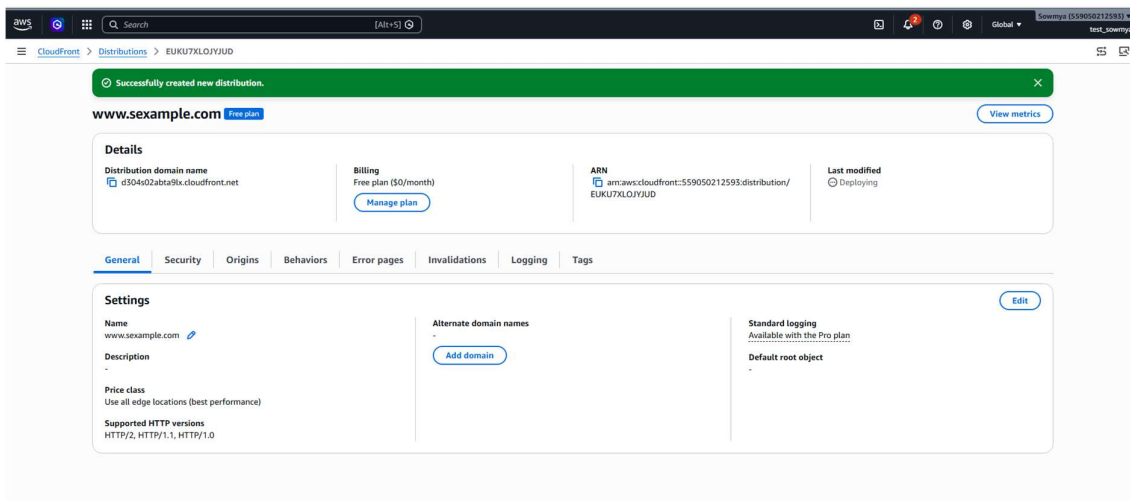

The screenshot shows the 'Edit static website hosting' page for the bucket 'www.sexample.com'. The 'Static website hosting' is set to 'Enable'. The 'Hosting type' is 'Host a static website'. A note indicates that for public access, the S3 Block Public Access settings must be edited. The 'Index document' is 'index.html' and the 'Error document - optional' is 'error.html'.

Step-4: Go to properties and copy the url. When you try to access the url it will show you 403 forbidden error.

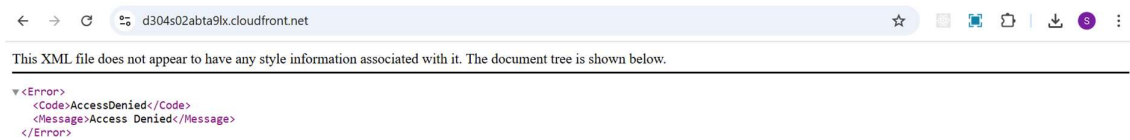

Since Block Public Access is enabled and no bucket policy grants public access, accessing the S3 website endpoint returns a 403 Access Denied error.

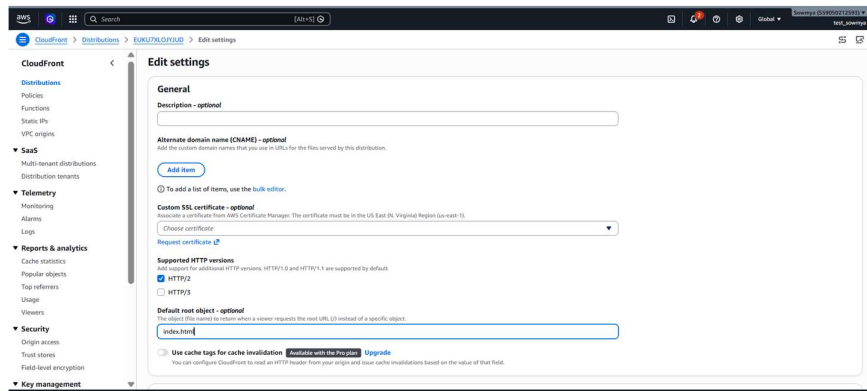

Step-5: Now go to cloud front and create a distribution.

Step-6: When I tried to access the webpage through cloud front distribution(use distribution domain name) I got following error.

To resolve this, Go to distribution->select general->click on edit and add index.html in default root object

The error occurred because the Default Root Object was not specified in the CloudFront distribution. As a result, CloudFront did not know which file to serve when the root URL was accessed. After setting the Default Root Object to index.html, CloudFront was able to retrieve and display the website successfully.

Hi

This is my first bucket creation.

Hurray!! Successfully able to access the webpage through cloud front distribution.

But if you try to access the same with s3 bucket endpoint url you won't be able to access it as public access is blocked.

403 Forbidden

- Code: AccessDenied
- Message: Access Denied
- RequestId: TY5T2SHBQ9N9R8AGF
