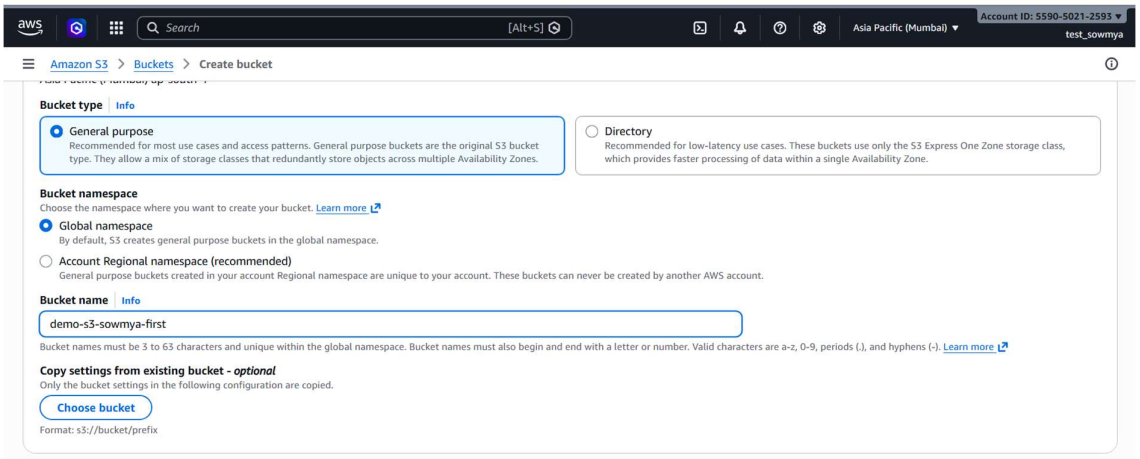
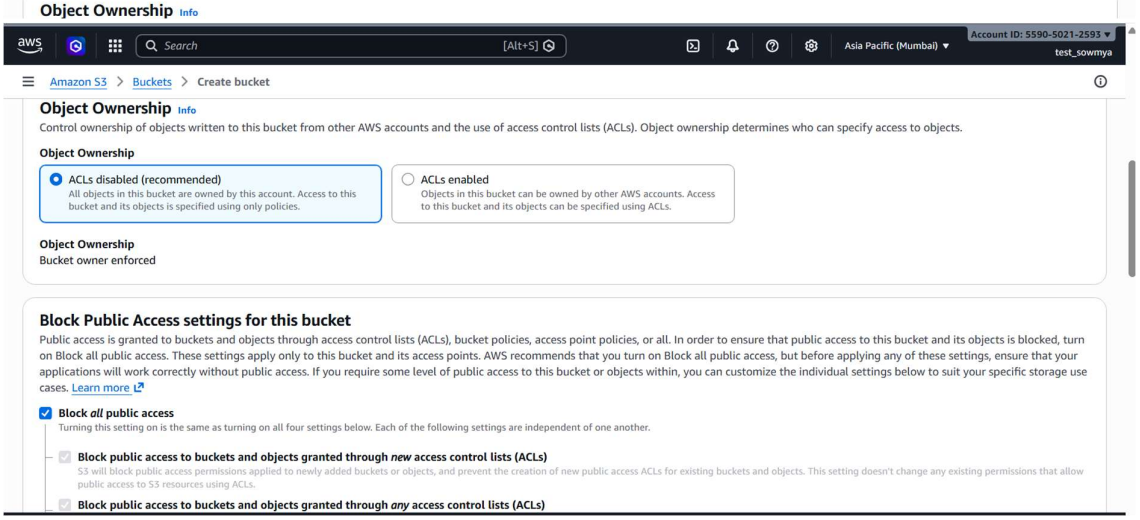
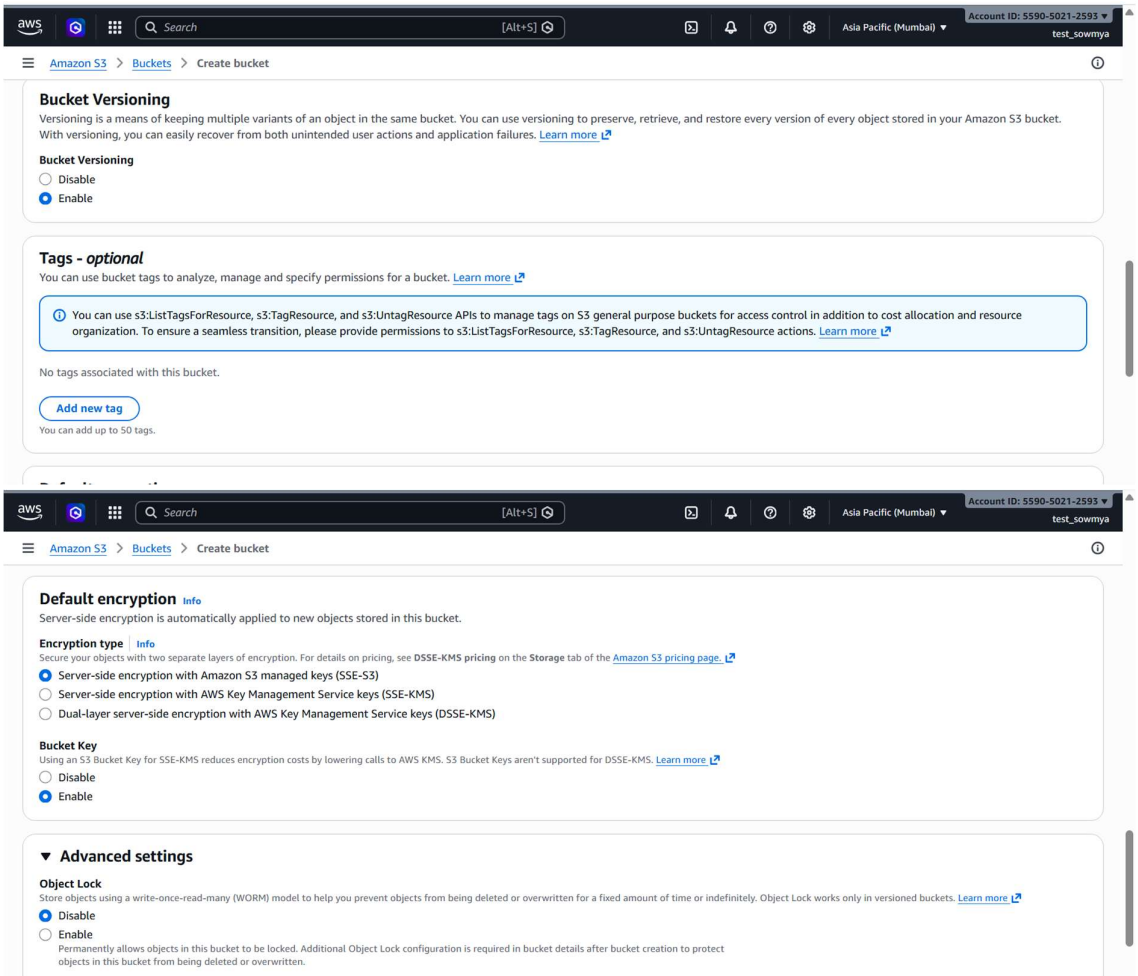
Implementation of S3 Bucket in AWS Console

Step 1: Login to your AWS console with IAM user and go to s3

Step 2: Click on Create bucket and give unique name for the bucket

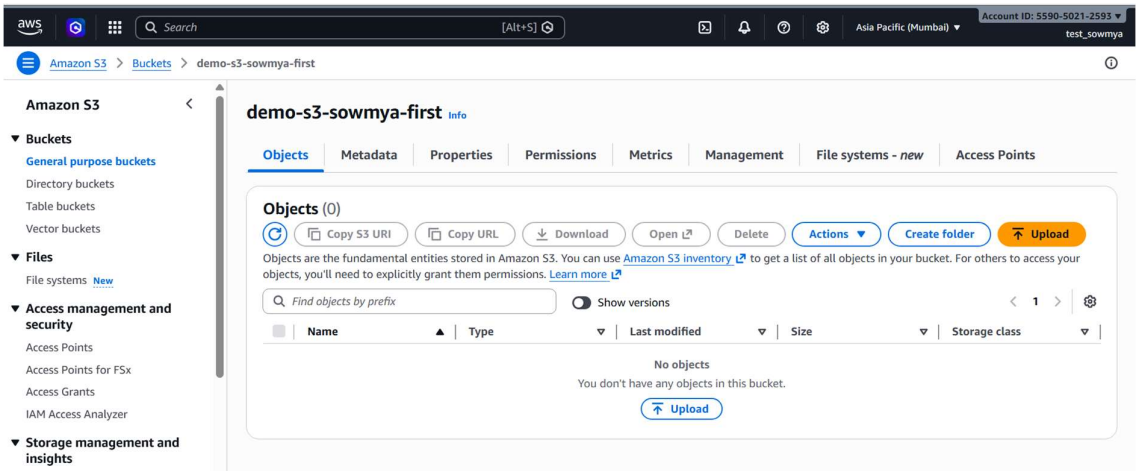




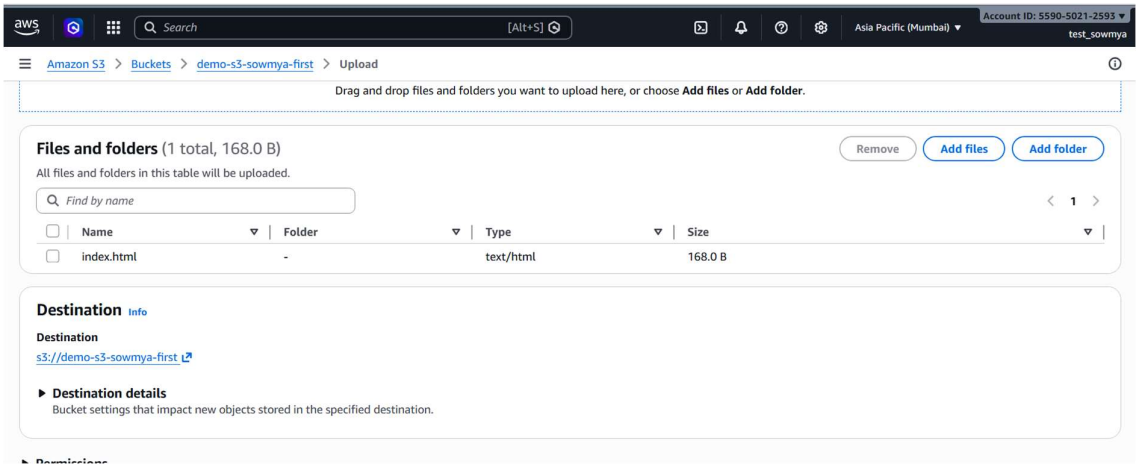


Step 3: Finally, Click on create Bucket.

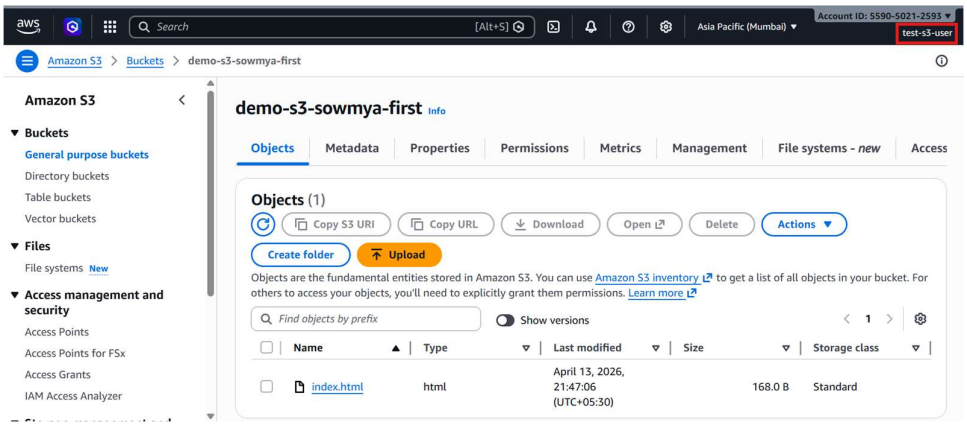
Step 4: Go to Buckets->select the Bucket you created. You will see like below



Step 5: Now click on upload and upload a file. Here I'm uploading a html file and then click on upload

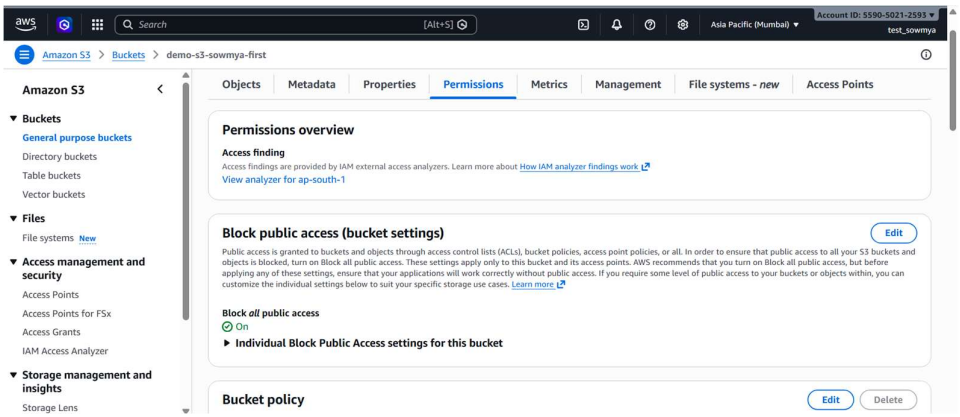


Step 6: Now, I have created another IAM user and now I will try to access the same file with that account

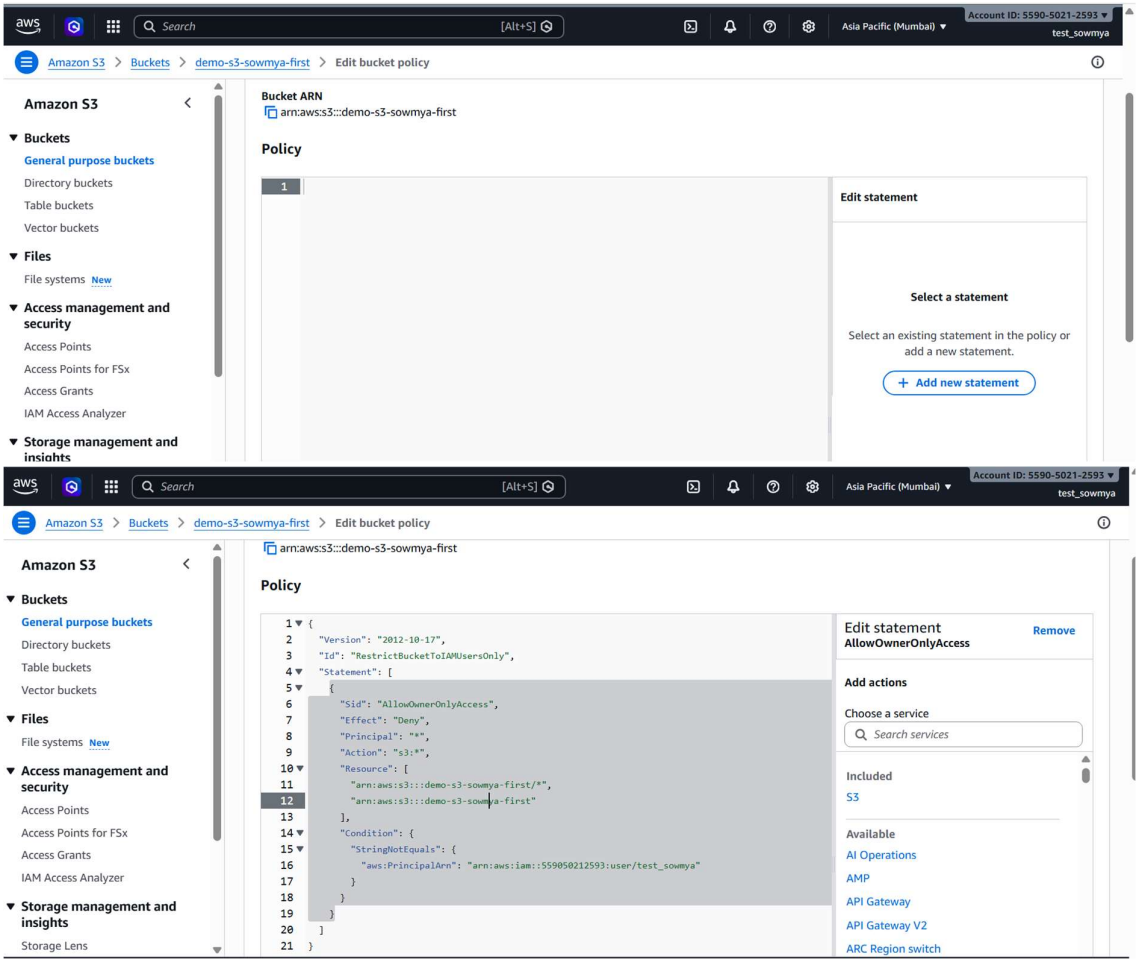


Now login to your test_sowmya, add bucket policy and then again will try accessing the file in test-s3-user account

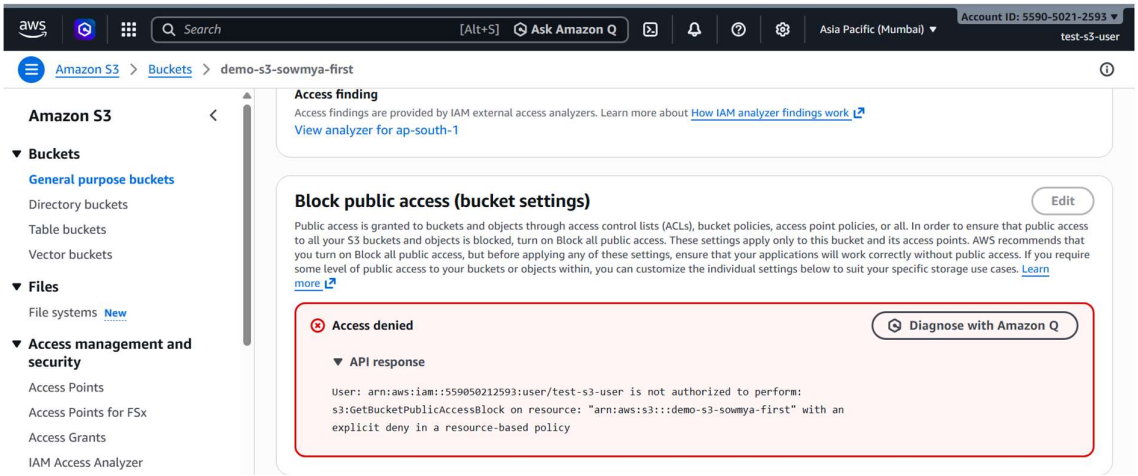
Step 7: Go to bucket you created then select permissions tab. You will see bucket policy down. Click on edit button



Step 8: Click on Add statement on right corner. You will get a default JSON format. Then edit it accordingly



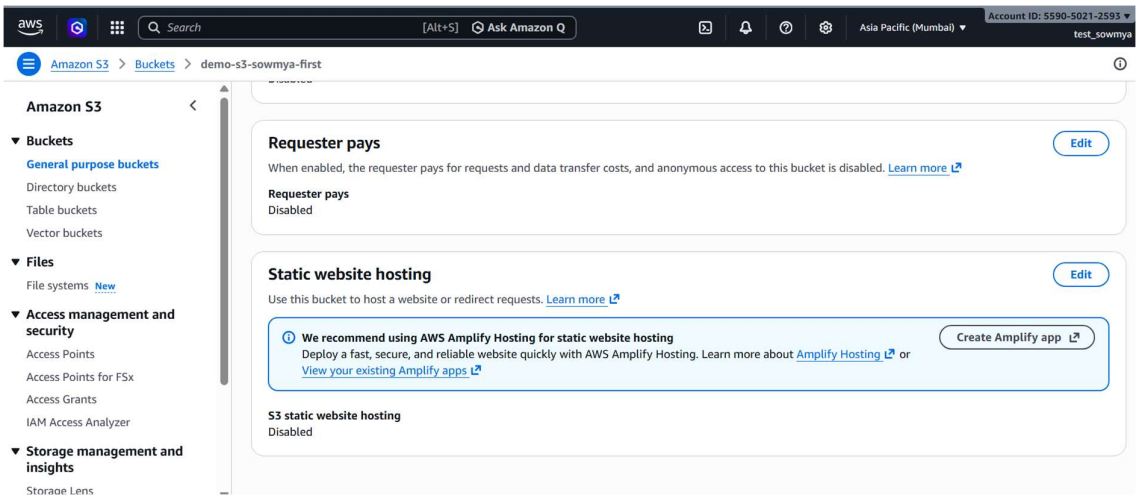
Step 9 : Login back to s3-user and try access the bucket.your access gets denied.



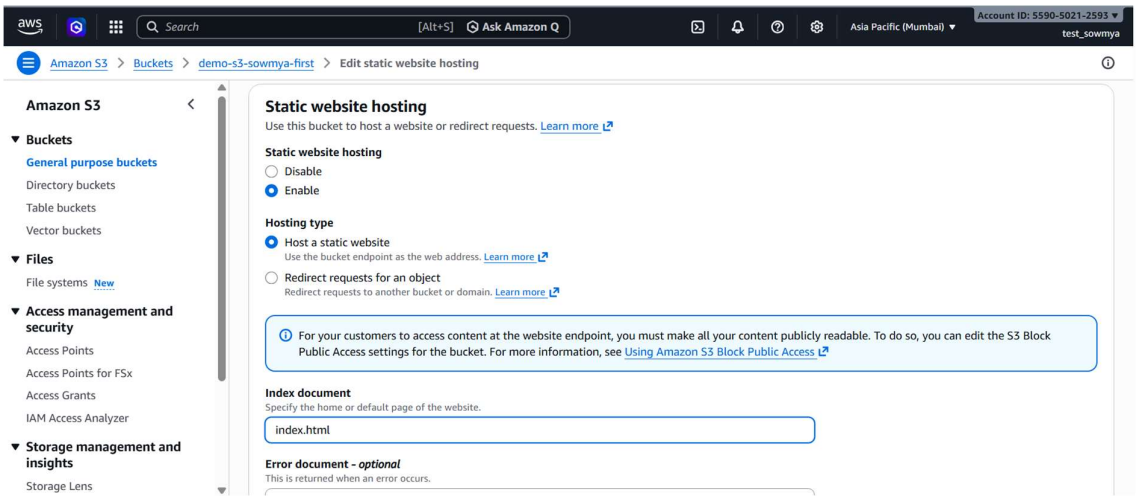
With bucket policies you can restrict the access.

Lets Deploy static website with help of S3

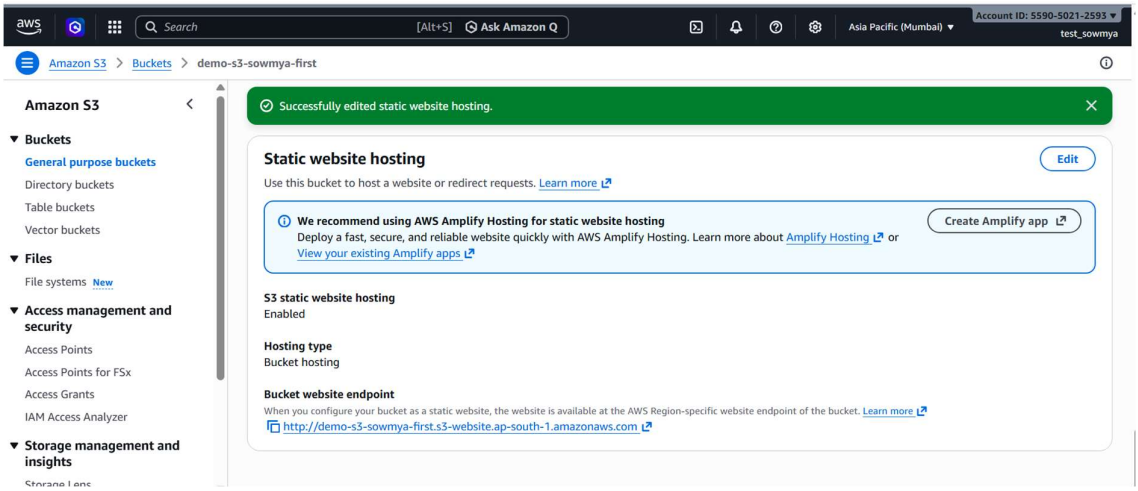
Step 1: Go to the bucket you created and select properties tab. Scroll down you will see static website hosting. Click on edit



Step 2: Make static website hosting enable and give your index document name. Then click on save changes



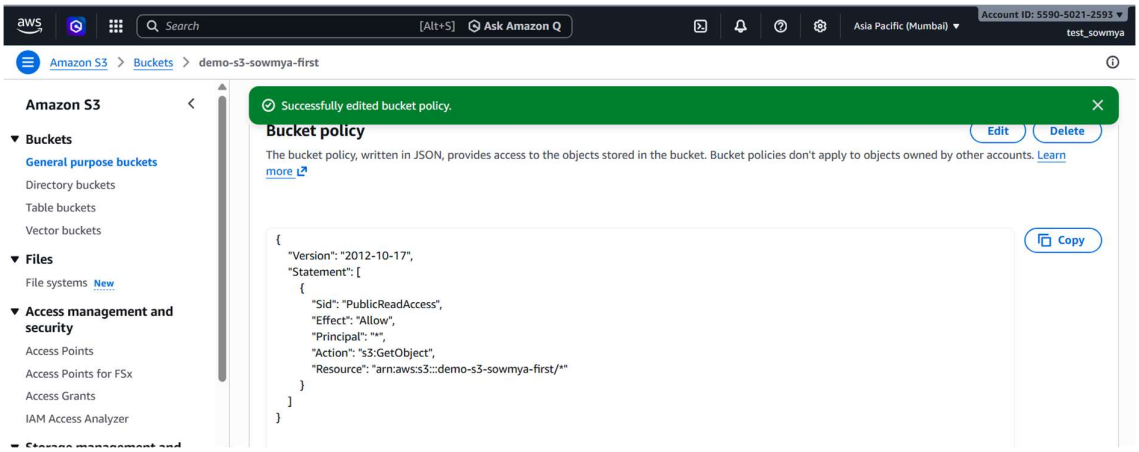
Now if you go down you will see the link for your static website hosting copy it and paste in browser.



You will see 403 forbidden error because you haven't made your bucket public.

Step 3: Go to bucket->permissions->disable the block public access and also delete the bucket policy you have created.

"S3 uses an implicit deny model, so public access must be explicitly allowed using a bucket policy."



Step 4: Now try to access the website again.

Hurray!!! We were successfully able to access the static website hosted in Amazon S3.
