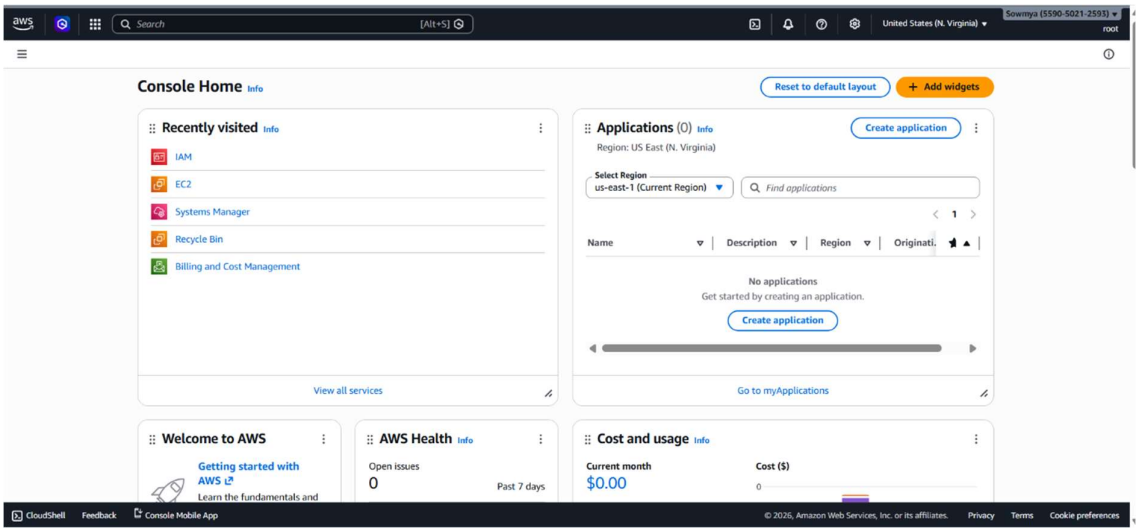
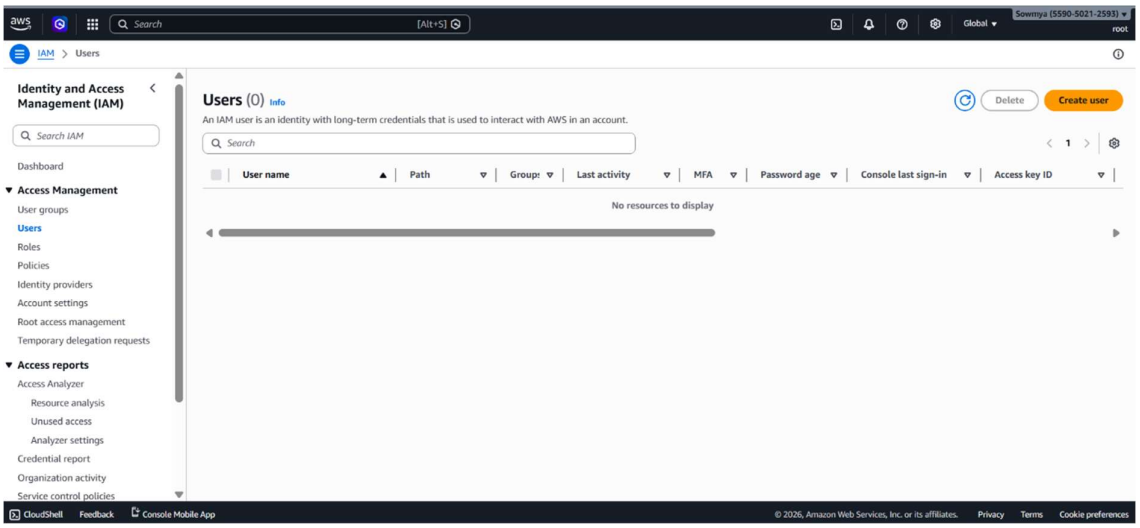
Creating IAM User, Groups In AWS Console with Permissions attached



Step 1: Login to your AWS console with your root user email

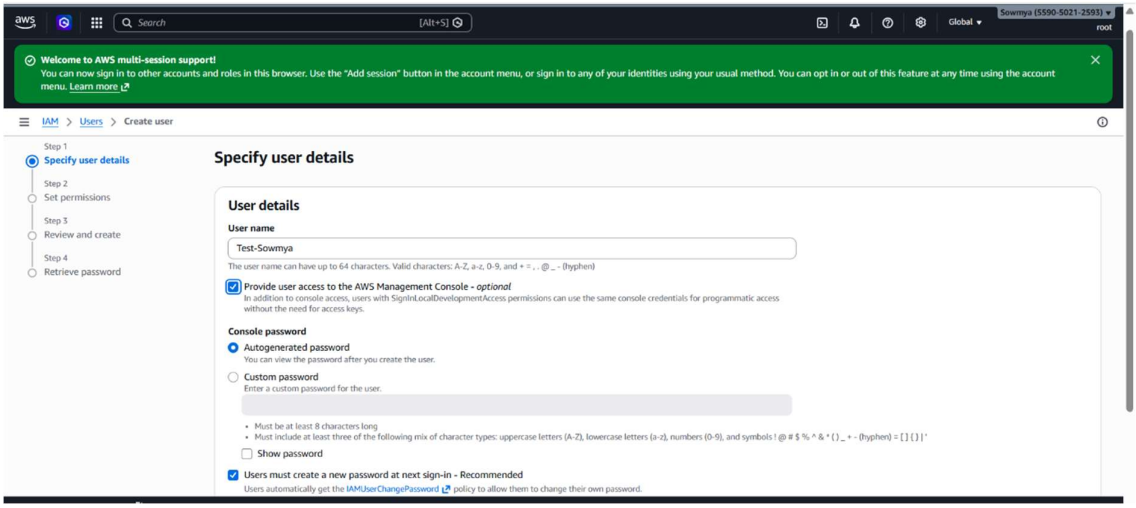
Step 2: Once you login it shows as above image, select IAM or if you cannot see like above image in search bar just type IAM.

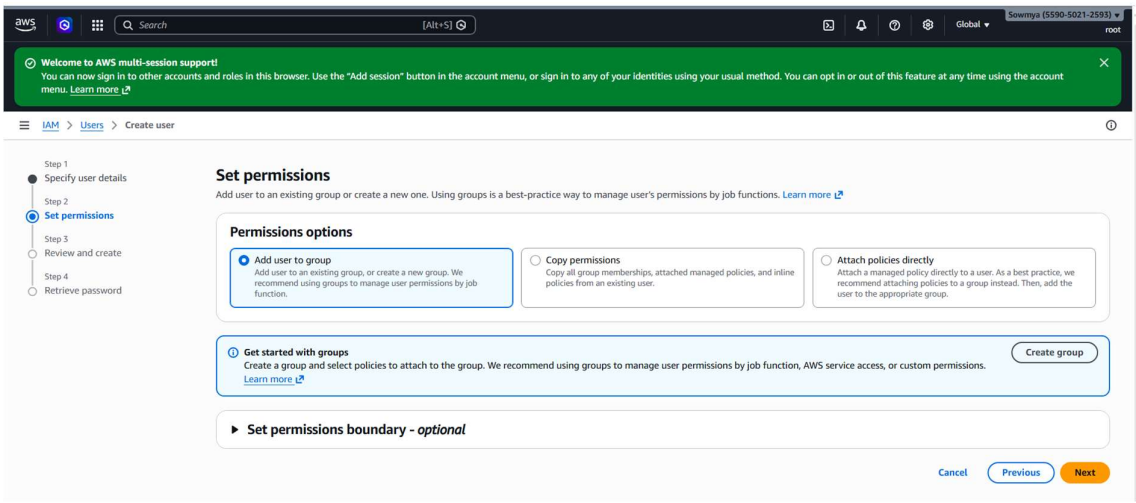


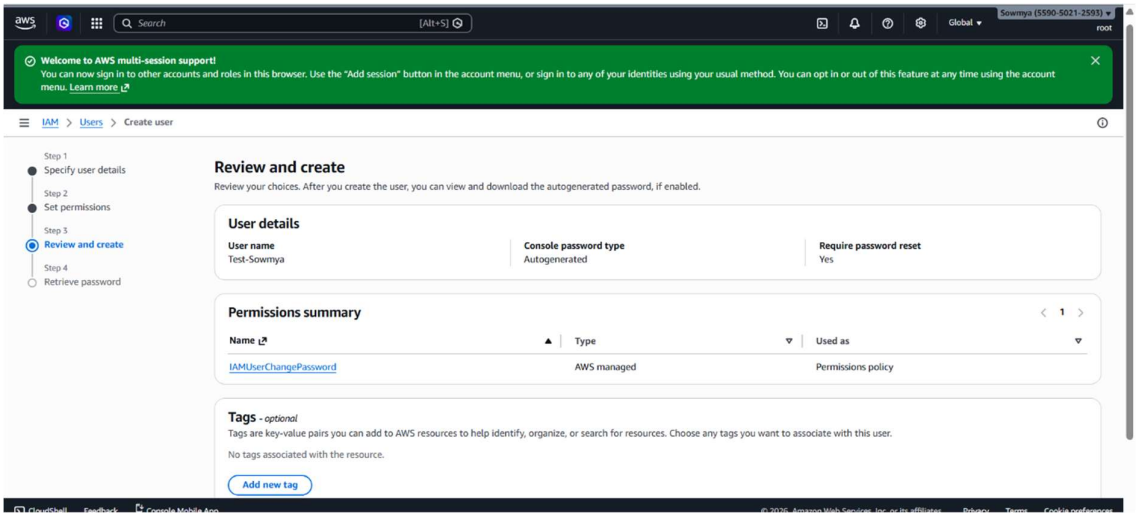
Step 3: Once you click on IAM it will appear as above image. Here go to top right corner and select Create user.

Step 4: It will redirect to a page as shown in below image. Fill the required details as shown in images below and click on submit

Here you are just creating a IAM user without any permissions.Remember by default AWS will attach IAMUserChangePassword permission so that once you login with your IAM user account you can change the password and set your custom password.

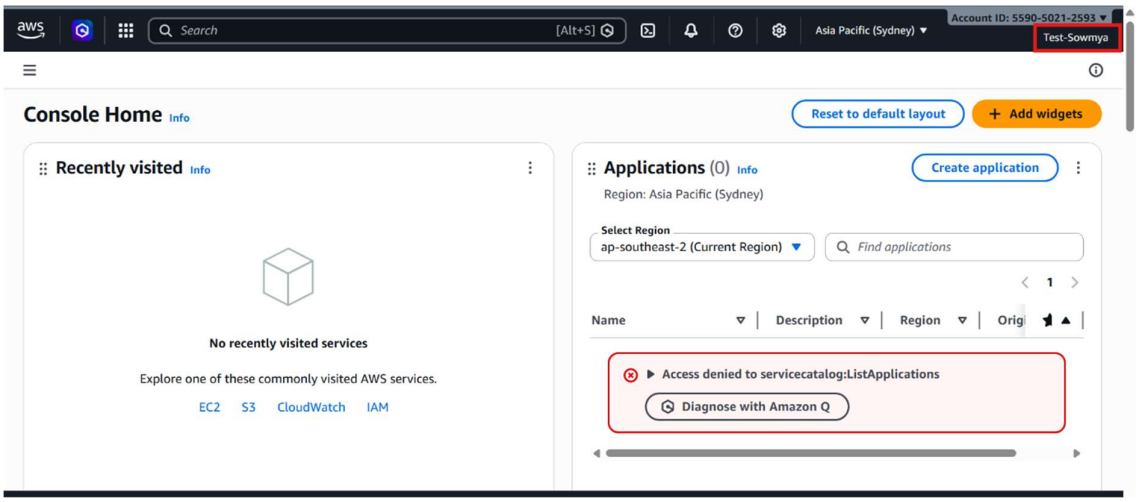




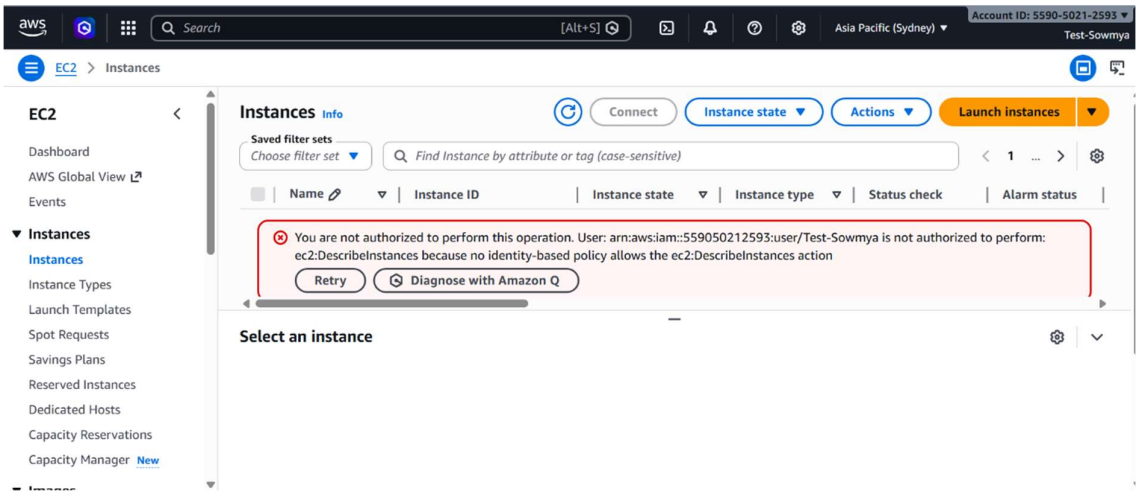


Step 4: Now, IAM user is created. Login with your IAM user credentials in to AWS console.

Once you login as IAM user you will see the screens as in below images.



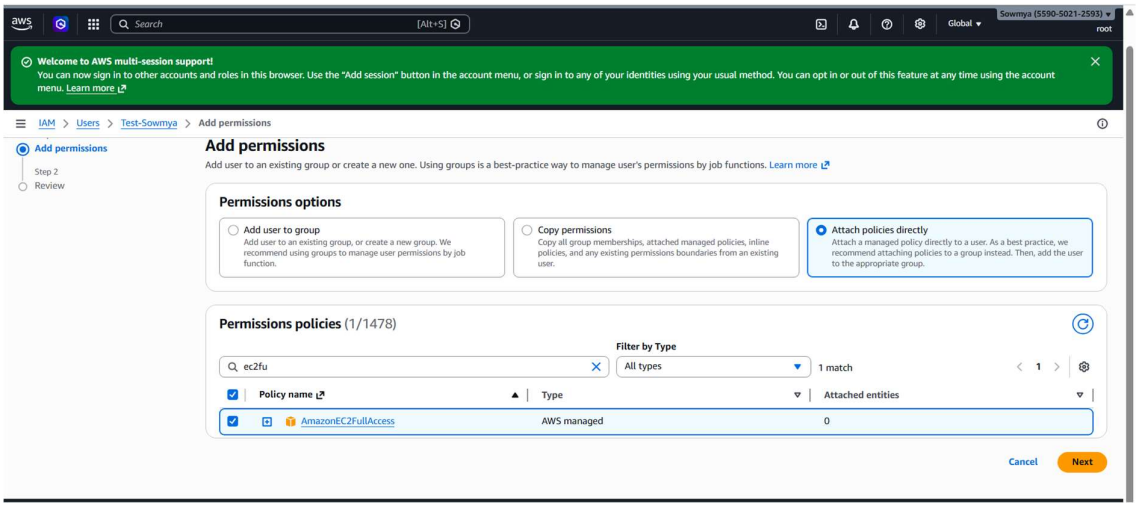
We did not attached any permissions to the IAM user account so we will not be able to perform anything. As you can see when I tried to open EC2 it is shown as below image.



Step 5: To create EC2 instance with your IAM user. We need first attach permissions.

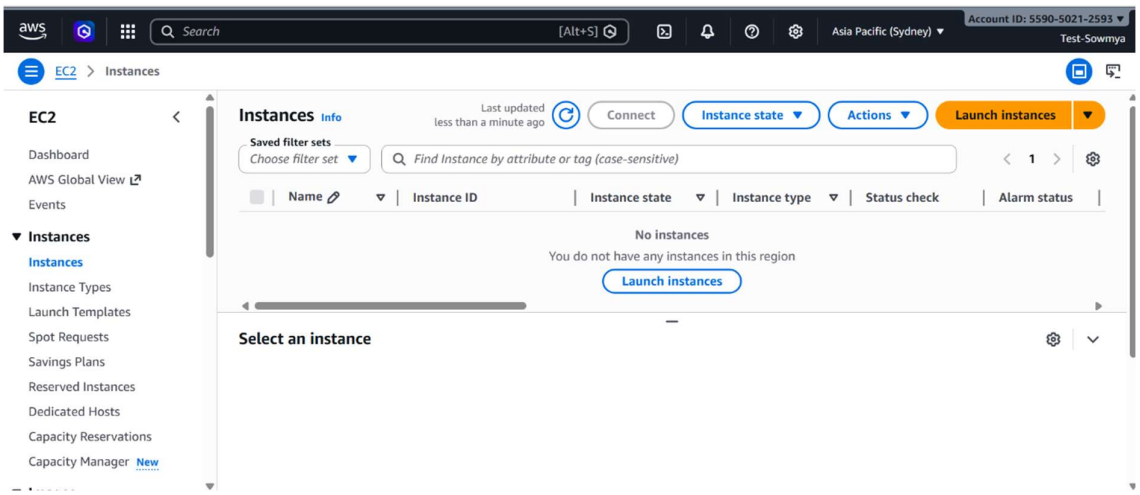
With your root account, Go to IAM user and select the user you have created, you will be able to Add Permissions button select it and then select attach policies directly. You will be redirected to a page as shown in below image. Now select the permissions which you want to give to your IAM account user. Once selected click on add permissions.

EX: Here, I'm attaching EC2 full access.



Step 6: Login with your IAM user account and go to EC2 in AWS console.

Now you will be able to see the screen as below image



How to attach User to a Group?

Step 1: With your aws root account, go to IAM->User groups and here in the user group name add the name of the group you want to create(as shown in image below) and attach the IAM user.

Step 2: If you want to attach permissions for the group you can attach and then click on create user group. The user group will be created.
