CLI (Command line interface) Demonstration

Step 1: If you are using Mac then install aws cli directly but if using windows then first download Virtual box and ubuntu. Complete the set up.

Step 2: Use below commands for AWS CLI installation.

```
sudo apt update

sudo apt install unzip curl -y

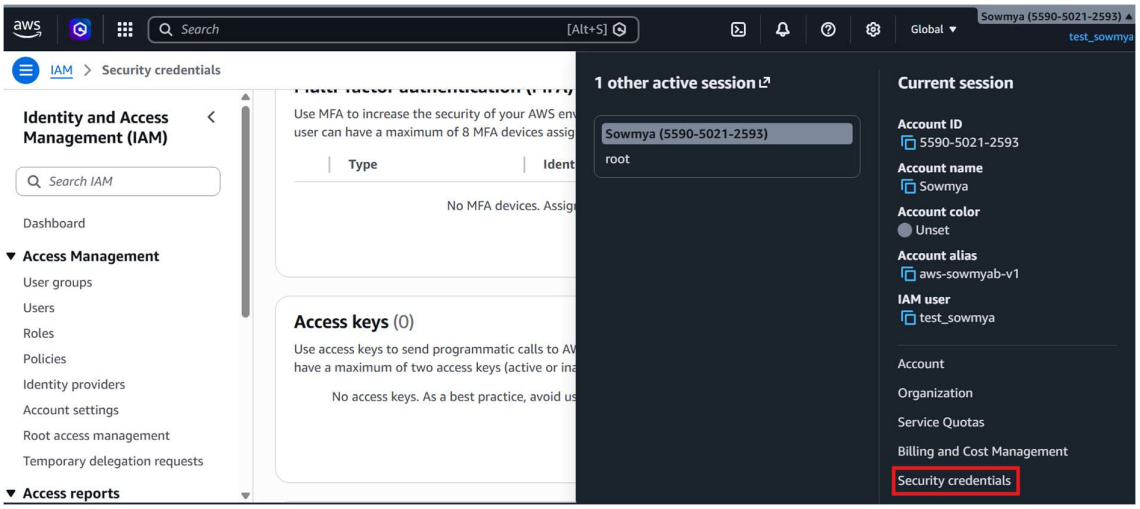
curl "https://awscli.amazonaws.com/awscli-exe-linux-x86_64.zip" -o "awscliv2.zip"

unzip awscliv2.zip

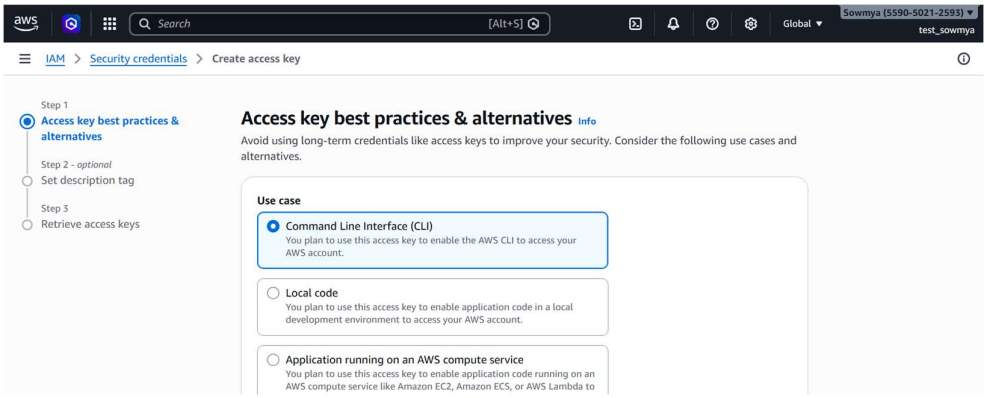
sudo ./aws/install

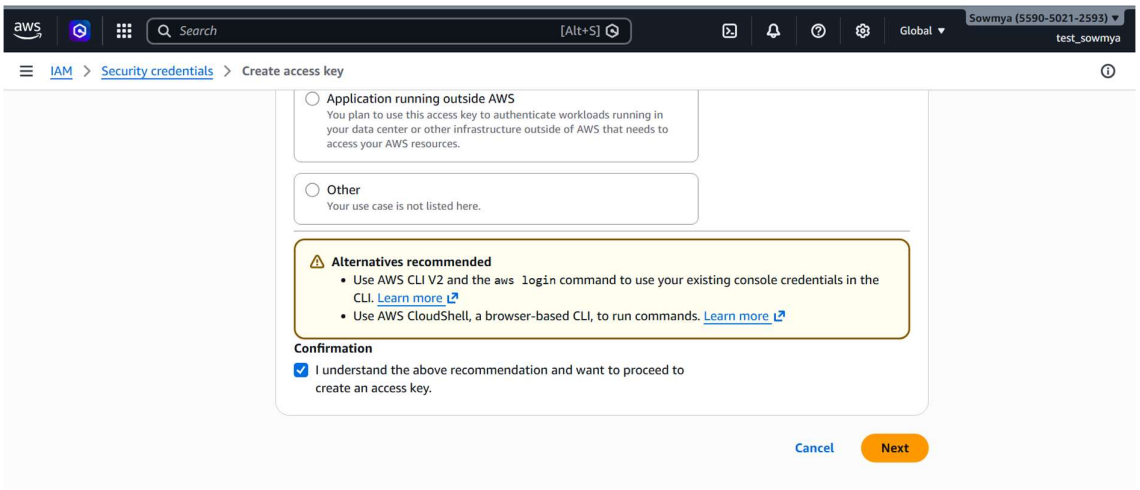
aws –version
```

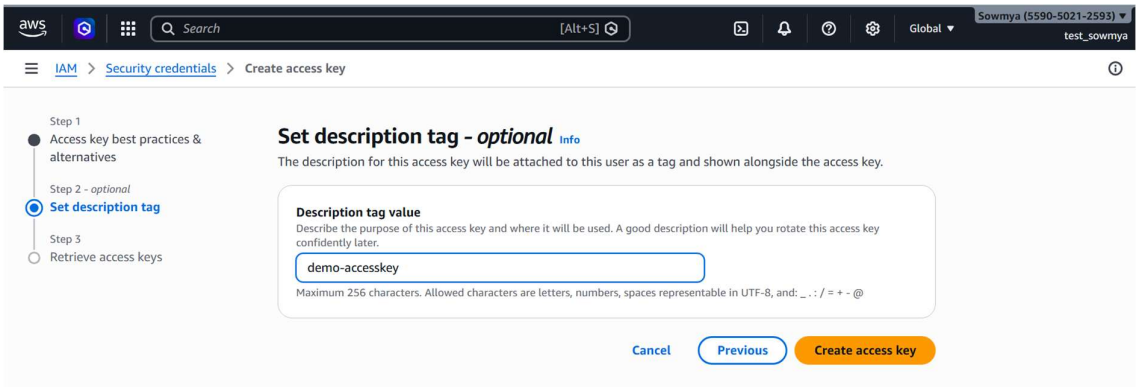
Step 3: Now login to your AWS console using IAM user credentials. Then click on top right corner on your IAM user name u will see a dropdown. Select security credentials



Step 4: Now scroll down you will see Access Keys button click on it to create access keys. After filling the details click on create access key.







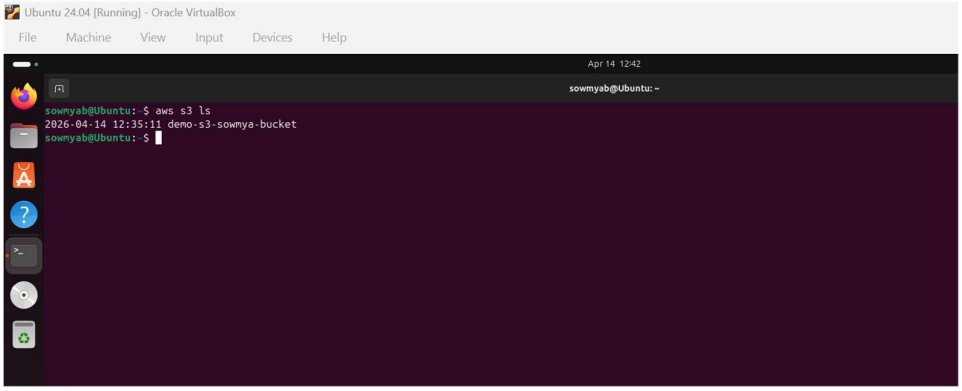
Step 5: Now go to your Ubuntu terminal and use command **aws configure**. To connect through your terminal.

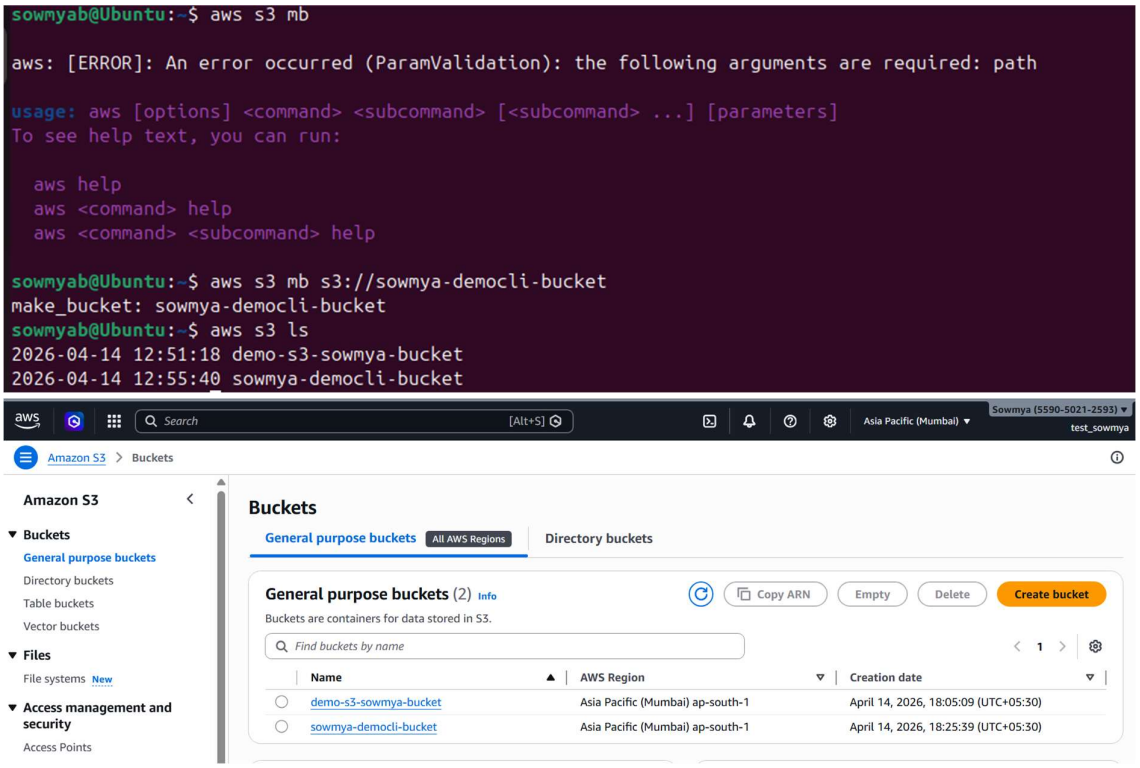
Enter your AWS credentials when prompted:

- AWS Access Key ID
- AWS Secret Access Key
- Default region (e.g., ap-south-1)
- Output format (json)

Note: Never share or commit your AWS credentials to anyone/anywhere.

Step 6: To verify if is configured correctly or not. Use aws s3 ls. If it prompts you the files present in your s3. Then, Hurray!! You have successfully connected to aws console through CLI



Step 7: If you want to perform some more operation use AWS CLI reference document from google


I have created a bucket through CLI
