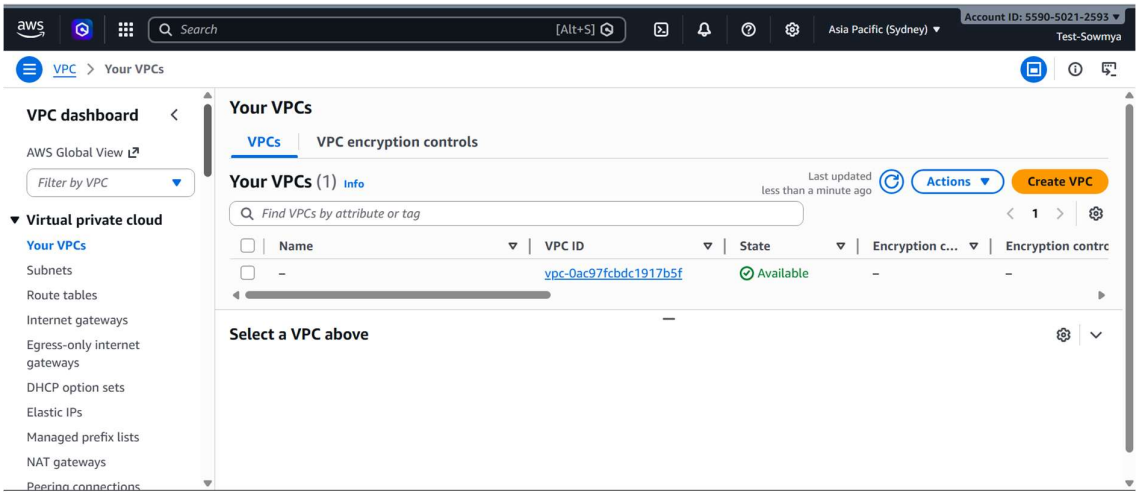
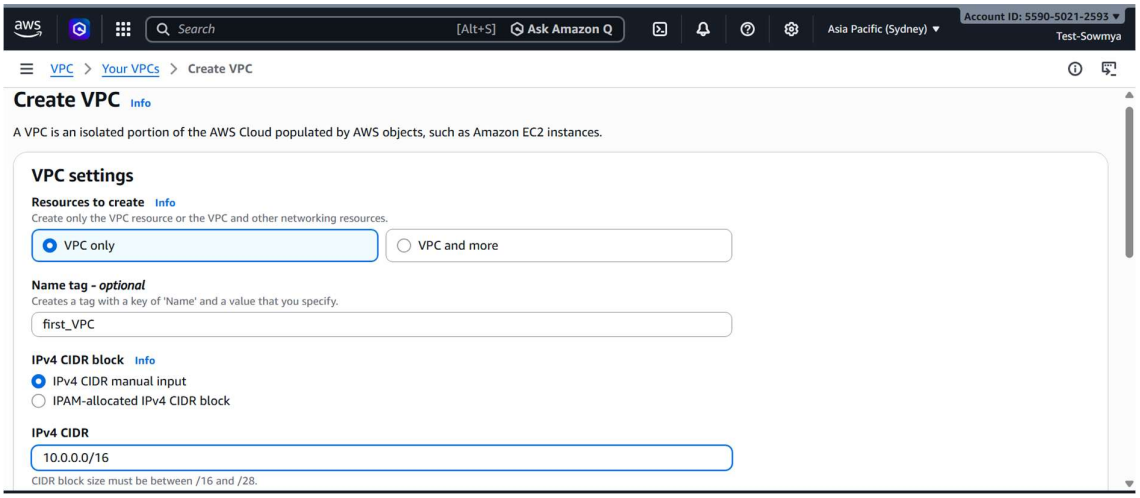
Creation of VPC

Step 1: Go to AWS Console->type VPC in search bar it will show as in below image. Remember there is a default VPC associated with your AWS account



Step 2: Click on create VPC on top right corner. Give name of the vpc in the name tag box.

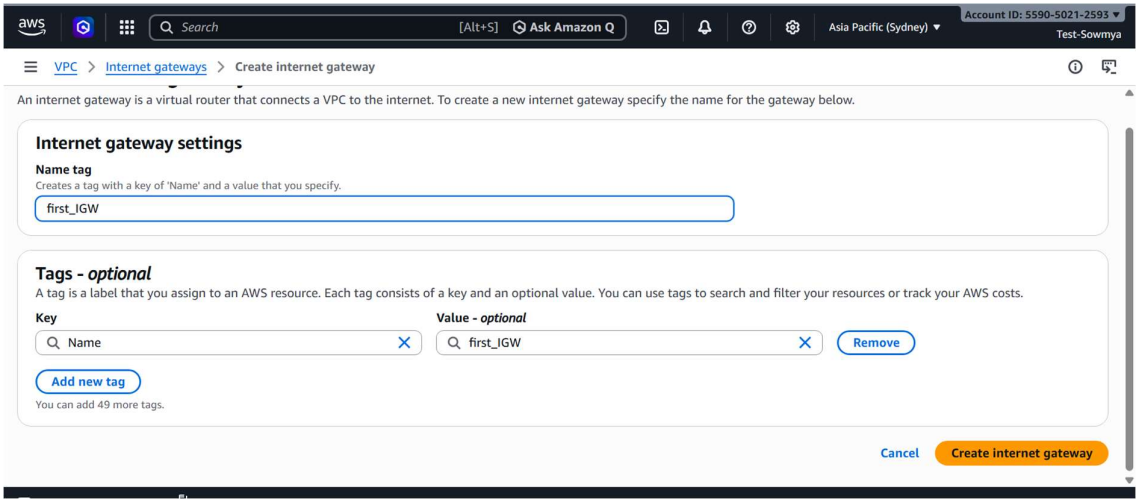
I am giving /16 as the AWS VPC restriction is minimum size-/28 and maximum size-/16.



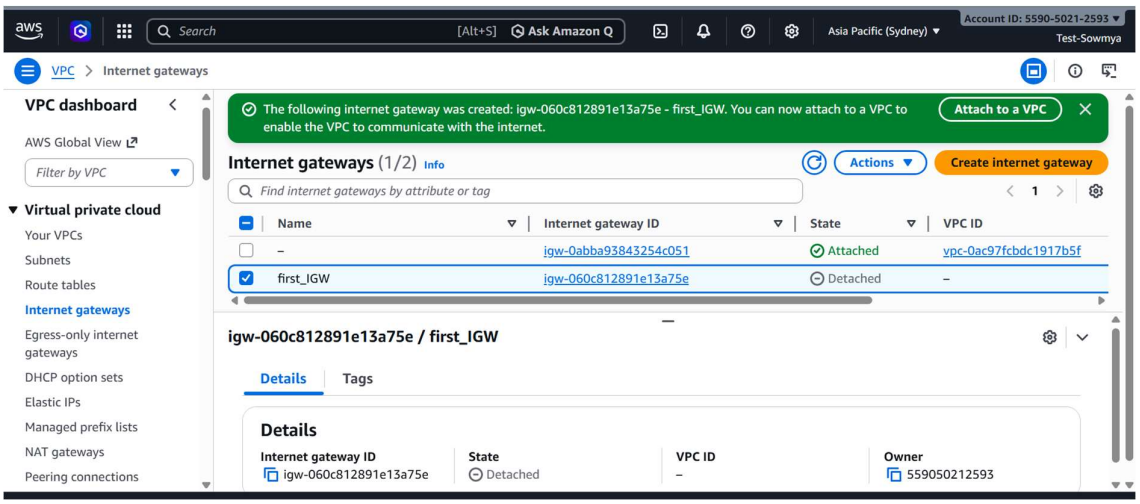
Step:3 Keep everything with default values and click on create VPC

Creation of Internet gateway

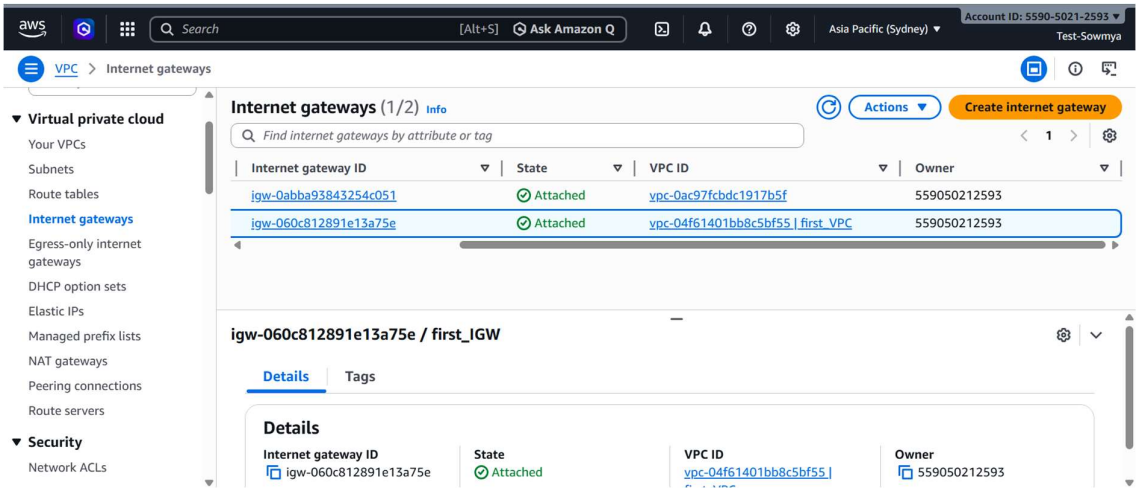
Step 1: Select internet gateway left corner and click on create internet gateway and give the name then click on create internet gateway



After creating internet gateway you have to manually attach it to your VPC. It will be in detached state at the beginning



Step 2: Click on Actions on top and select attach to VPC then select your VPC to attach.

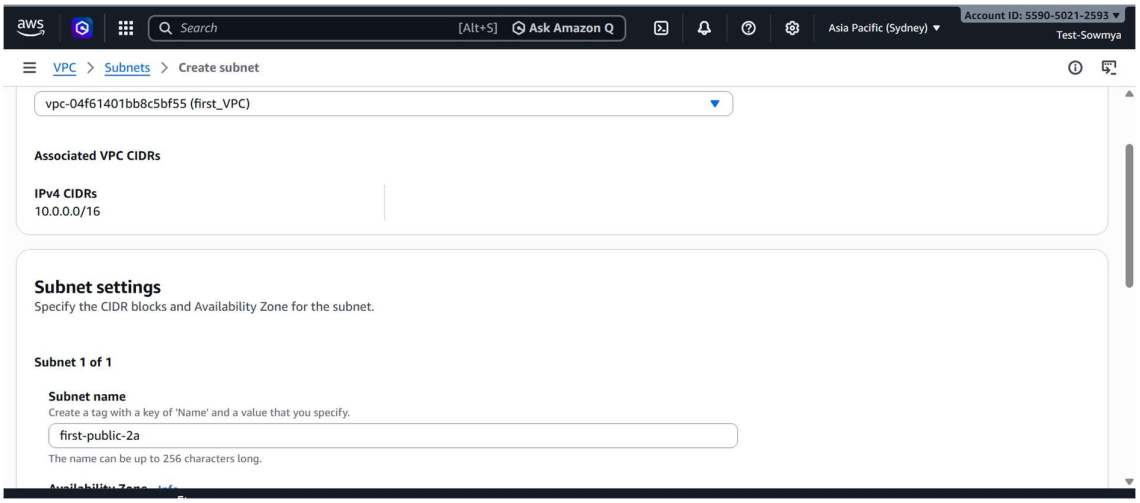


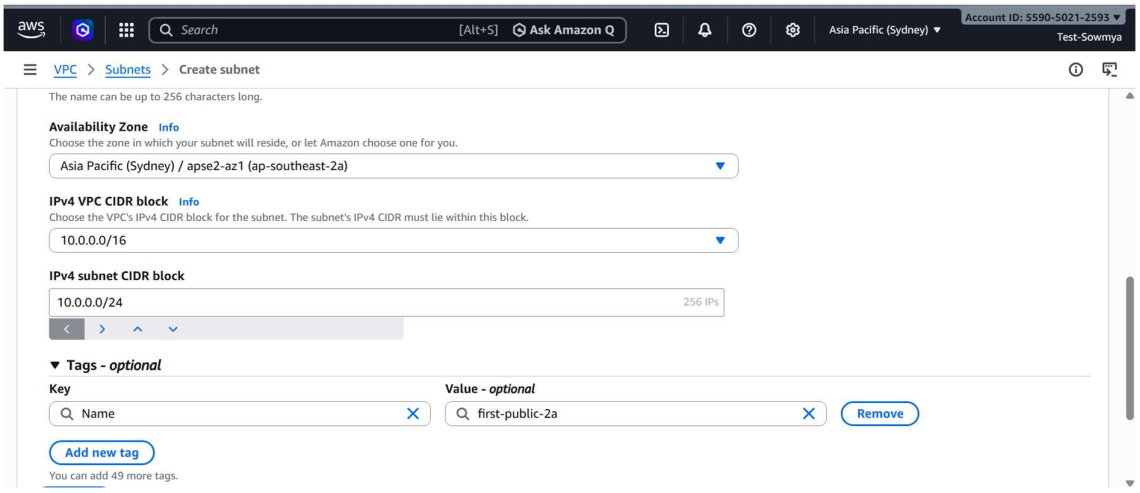
Creation of subnets

Step 1: Select subnets on left side of the AWS console. You will be able to see default subnets which are already created.

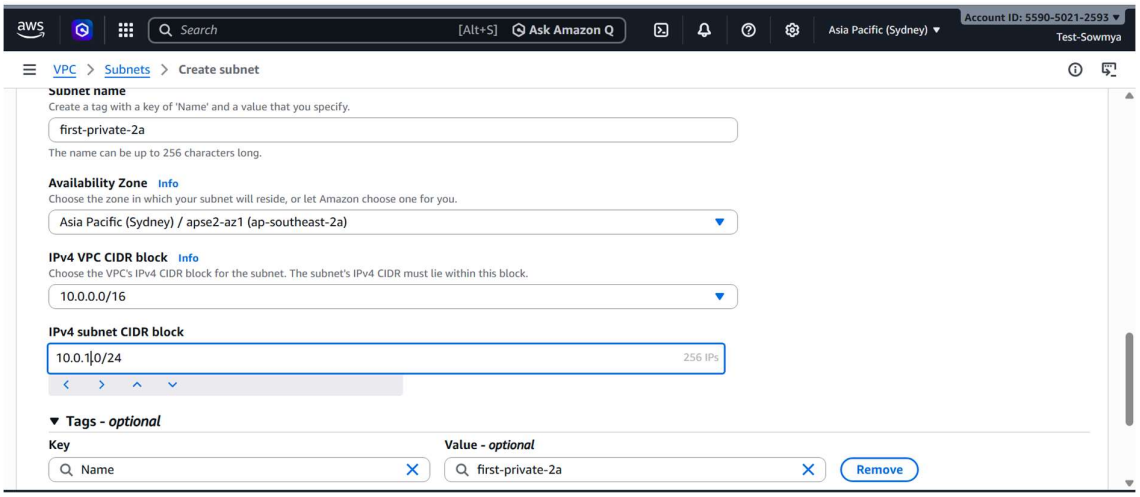
“AWS creates one default subnet per Availability Zone in a region.”

Step 2: Select the VPC you have created and give name of your subnet. Here I’m giving 2a just to remember the AZ(availability zone).



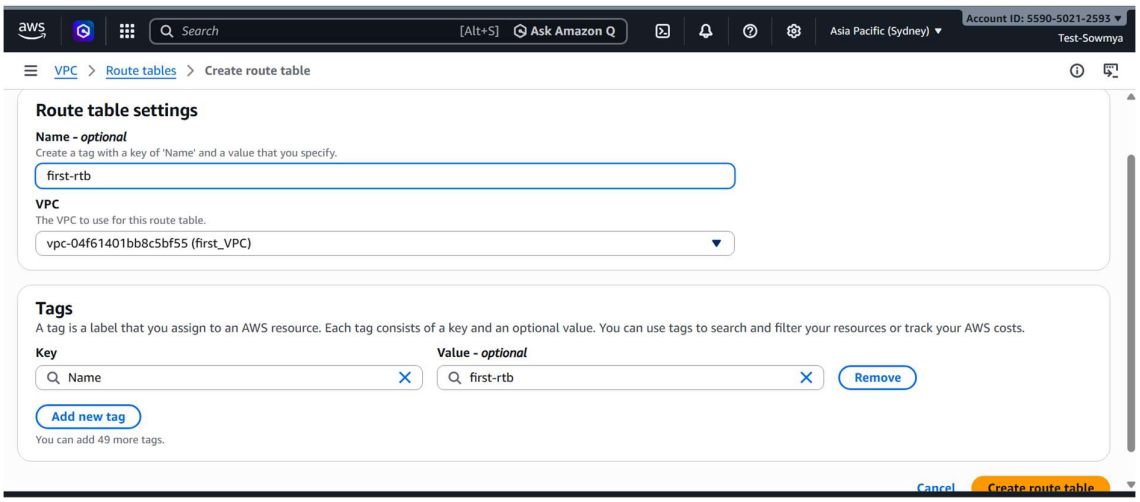


Step 3:Same way create private subnet too.

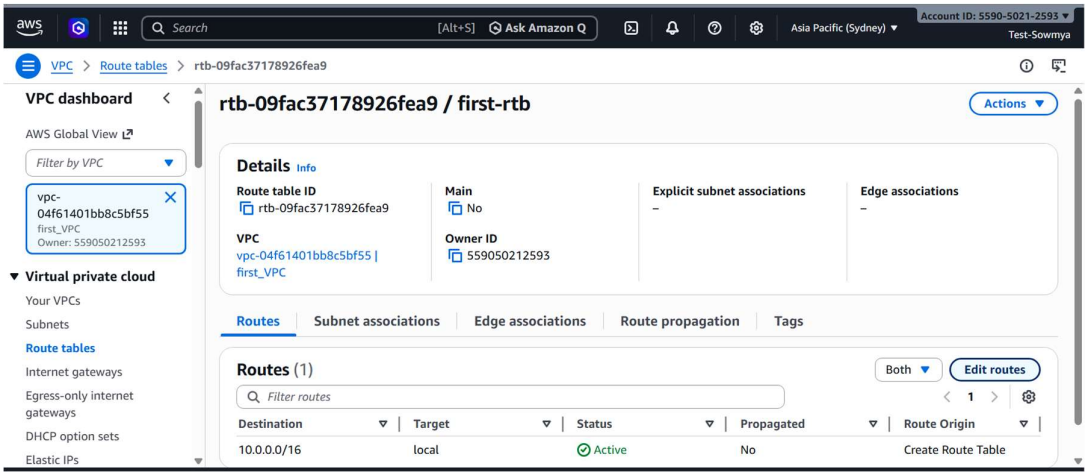


Creation of Route Tables

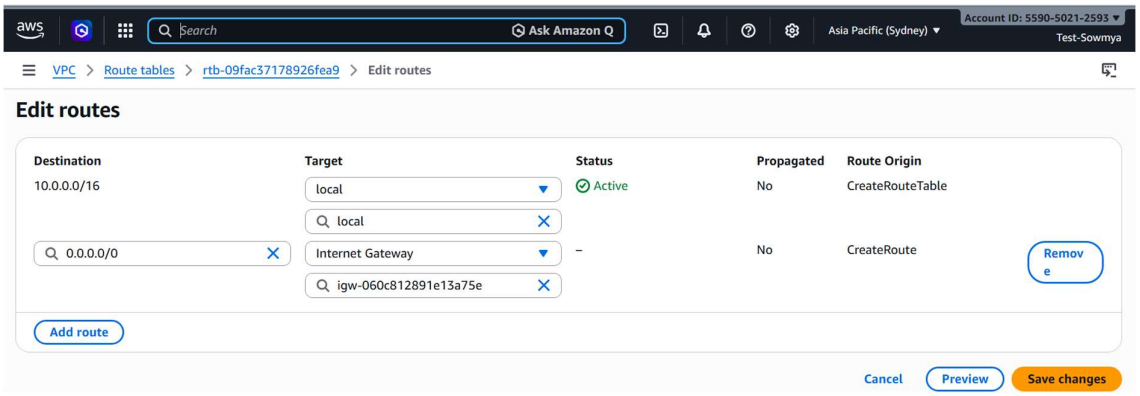
Step 1:Select Route tables on the left side of console and click on create Route table



Step 2: To access internet(public subnet), we have to edit routes. So go to route tables->select the route table you created. Down you can see edit routes button click on it.

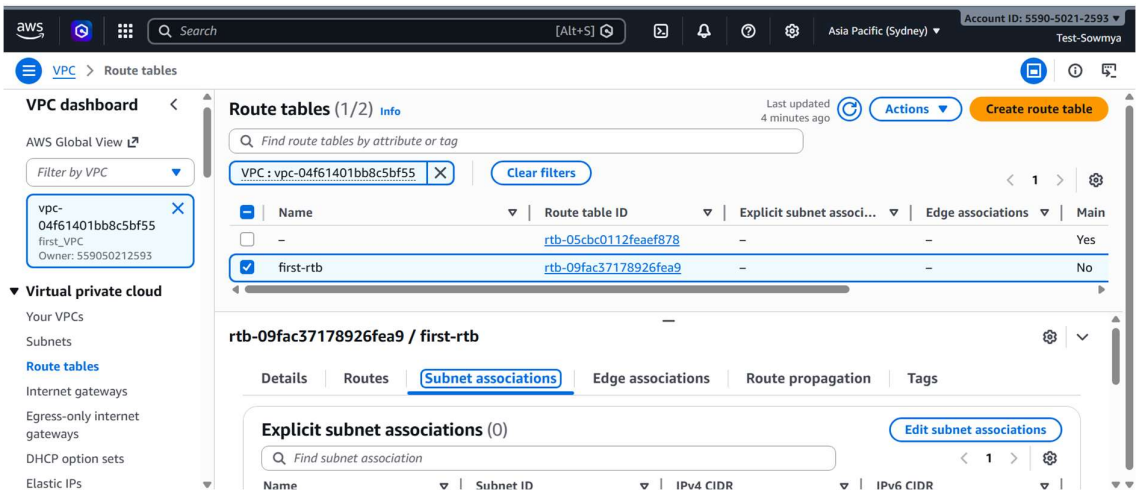


Step 3:Click on add route and add 0.0.0.0/0(to access internet). Select the internet gateway you created and click on save changes.

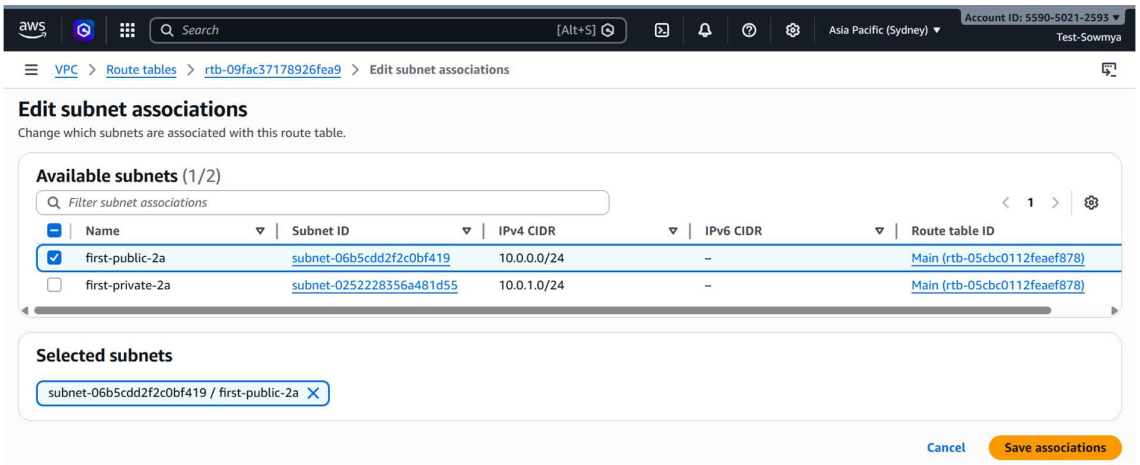


Attach route table to public subnet

Step 1: Go to route table and select edit subnet associations



Step 2: Attach public subnet to Route table(as this route table has internet access).



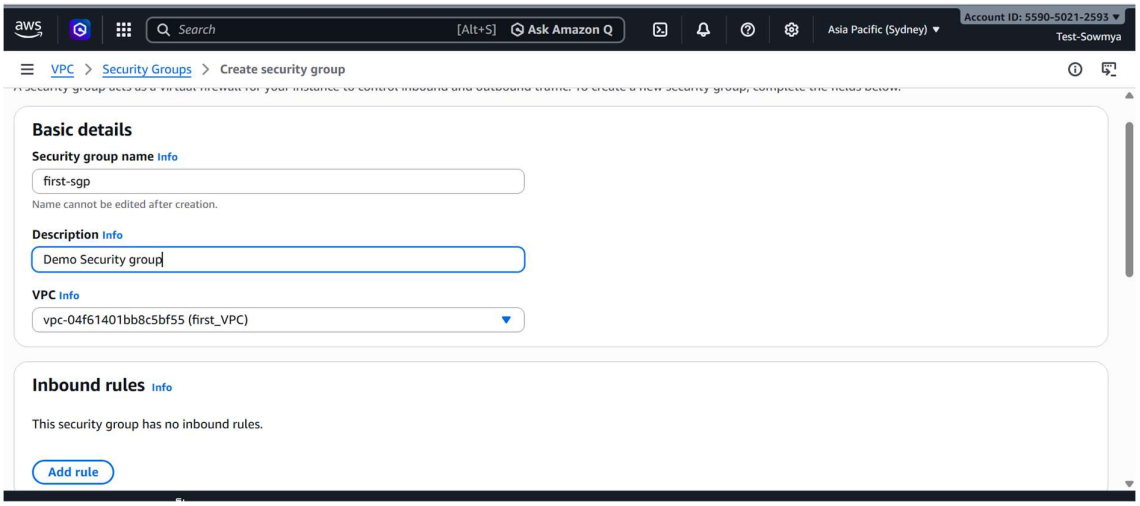
Now create another route table for attaching the private subnet. Follow the same steps we mentioned above for public route table and subnet.

Creation of Security Group

You can also create security group while launching your ec2 instance

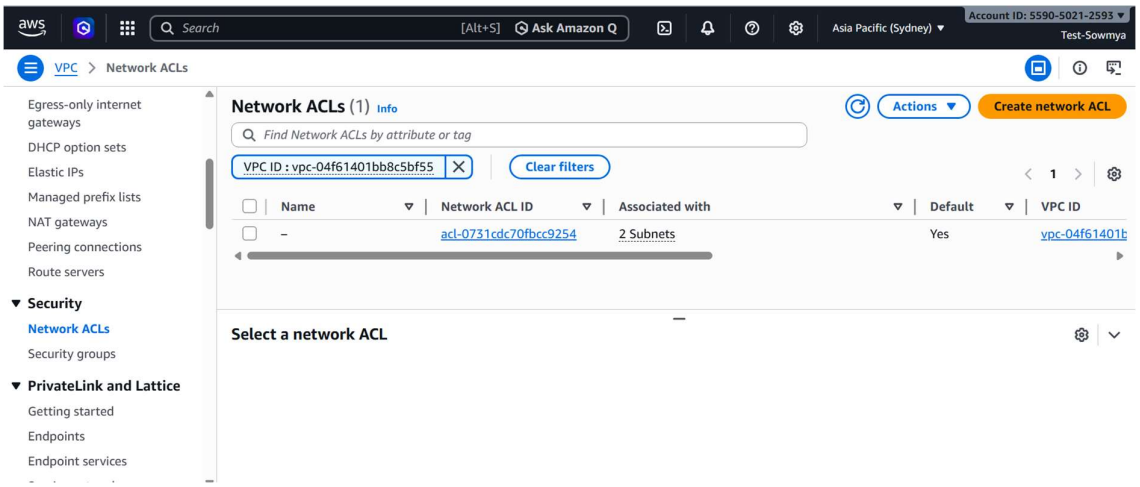
Step 1: Select the security group on left side of console and click on security groups

Step 2: Give the name and select the VPC you have created. For now I am not attaching any inbound rules. Click on create security group



Creation of NACL

Step 1: In AWS console select Network ACL on left side.



Step 2: Click on create network ACL and give name. Select the VPC you have created then click on the create network ACL.
